Questions?
Ask your Rite Aid Pharmacist.

or if the inhaler was dropped. When priming the inhaler, make sure to spray away from the face so that you do not get the medication into your eyes. Shake the inhaler well for 5 seconds before each use. Inhale this medication by mouth as directed by your doctor, usually twice daily (in the morning and evening, 12 hours apart). If your prescribed dose is 2 puffs, wait at least one minute between them. If you are using other inhalers at the same time, wait at least 1 minute between the use of each medication, and use this drug last. To prevent dry mouth, hoarseness, and oral yeast infections from developing, gargle, rinse your mouth with water and spit out after each use. Do not swallow the rinse water. Clean the inhaler once a week with a dry cloth. Do not take the inhaler apart. The dosage is based on your medical condition and response to treatment. Use this medication regularly in order to get the most benefit from it. This medication works best if used at evenly spaced times. To help you remember, use it at the same times each day. Do not increase your dose, use this medication more often, or stop using it without first consulting your doctor. Also, do not use other long-acting beta agonists while using this medication. If you are regularly taking a different corticosteroid by mouth (such as prednisone), you should not stop taking it unless directed by your doctor. Some conditions (such as asthma, allergies) may become worse when the drug is suddenly stopped. If you suddenly stop taking the drug, you may also have withdrawal symptoms (such as weakness, weight loss, nausea, muscle pain, headache, tiredness, dizziness). To help prevent withdrawal, your doctor may slowly lower the dose of your old medication after you begin using budesonide/formoterol. Tell your doctor or pharmacist right away if you have withdrawal. See also Precautions section. If you have been using a quick-relief inhaler (such as albuterol, also called salbutamol in some countries) on a regular daily schedule (such as 4 times daily), you must stop this schedule and only use the quick-relief inhaler as needed for sudden shortness of breath/asthma attacks. Consult your doctor for details. It may take 1 week or longer before you get the full benefit of this drug. Tell your doctor if your symptoms do not improve or if they worsen. Learn which of your inhalers you should use every day (controller drugs) and which you should use if your breathing suddenly worsens (quick-relief drugs). Ask your doctor ahead of time what you should do if you have new or worsening cough or shortness of breath, wheezing, increased sputum, worsening peak flow meter readings, waking up at night with trouble breathing, if you use your quick-relief inhaler more often (more than 2 days a week), or if your quick-relief inhaler does not seem to be working well. Learn when you can treat sudden breathing problems by yourself and when you must get medical help right away.

SIDE EFFECTS

Headache, throat irritation, or stomach upset may occur. If any of these effects last or get worse, tell your doctor promptly. Remember that this medication has been prescribed because your doctor has judged that the benefit to you is greater than the risk of side effects. Many people using this medication do not have serious side effects. This medication may raise your blood pressure. Check your blood pressure regularly and tell your doctor if the results are high. Rarely, this medication may cause severe sudden worsening of breathing problems/asthma immediately after use. If you have sudden worsening of breathing, use your quick-relief inhaler and get medical help right away. Tell your doctor right away if you have any serious side effects, including: white patches on tongue/in mouth, signs of infection (such as sore throat that doesn't go away, fever), mental/mood changes (such as nervousness), trouble sleeping, vision problems (such as blurred vision), increased thirst/urination, muscle cramps, shaking (tremors). Get medical help right away if you have any very serious side effects, including: chest pain, fast/slow/irregular heartbeat, severe
